CIA Control Plane

System architecture / Review edition / 03 Nov 2026

One brief to a verified post. AI assists creative judgment; code enforces permissions and execution; humans own approvals and unresolved work.

Deterministic code · Model-assisted + production work · Human decision · External adapter · Sensitive hold / no model

DESIGN, NOT LIVE OPERATIONS

Source briefs
ID, lineage, platform, expiry

Editorial policy
Relevance, validity, priority

Voice guide + asset briefs
Claims sources, rights, format

Account + approval registry
Scopes, consent, paid authority

SENSITIVE HOLD No model call. Authorized human reviews or redacts; otherwise stop.
If released: create a new version and restart triage. This is not publishing approval.

1 · INTAKE
Normalize
- Stable brief ID
- Source + timestamp
- Platform / format
- Preserve provenance

2 · TRIAGE
Creative gate
- Expiry + evidence
- Editorial relevance
- Human priority pick
- Assets/access later

3 · PRODUCTION
Plan + build
- AI draft + asset plan
- Human / media work
- Versioned asset set
- Owner + work limits

4 · REVIEW
Judge + verify
- AI critic + human
- Claims support / fit
- Rights + disclosures
- Pass / revise / block

5 · APPROVAL
Sign version
- Category approver
- Founder / paid routes
- Budget authority
- Edits void approval

6 · PREFLIGHT
Publish gate
- Assets + usage rights
- Account + approval
- Due time + AI labels
- Recheck every send

7 · PUBLISH
Queue + send
- Idempotent request
- Provider adapter
- Delivery result
- Verify every send

8 · RECONCILE
Verify outcome
- Receipt / live URL
- Unknown: hold/check
- Definite fail: queue
- No blind resend

9 · MEASURE
24h / 72h
- Verified receipt
- Channel baseline
- Metric provenance
- Missing data ≠ zero

DEFER / EXPIRE
Not ready ≠ discarded.

REVISE → PRODUCTION
Bounded cycles + total call budget

FAIL → OWNED BLOCKER
Approval never overrides preflight.

UNKNOWN → RECONCILE
Check provider evidence before retry.

OWNED BLOCKERS + ESCALATION

Missing access, footage, evidence or sign-off creates a blocker: reason → accountable owner → due time → escalation target → resolution evidence.

Overdue → escalation queue. Unassigned → coordinator queue. Resolution → re-enter the failed stage; changed content → new version and fresh approval.

STATE + AUDIT

SQLite runtime: versions, approvals, outbox, receipts.
ClickUp: intended human work surface, sync pending.
Every transition attributed; approvals never inferred.

OPERATIONS

Time blocked • approval latency • delivery success
Pause + spend/call caps + failure queue
WIP 3: active production through unresolved send.

QUALITY

Factual corrections • rewrites • policy misses
Deterministic evidence presence is not claim truth.
Human/model judgment stays separate from checks.

PERFORMANCE

Channel baseline + comparable post metrics
No baseline = insufficient evidence.
No automatic publishing-autonomy promotion.

Results + editorial review inform the next triage decision

RELEASE BOUNDARY: review-ready design + local starter. Models, publishing and metrics are simulated; real identity, integrations and monitored workers are not connected.

PILOT ACCEPTANCE: one blocked brief resolved to a verified live receipt without manual chasing. Still to prove. Nothing in this diagram authorizes sending or spending.
